Course Aims

The first part of the course aims to reinforce students with the basic concepts and applications of Quantum mechanics to various molecular, chemical and spectroscopic applications. You will learn how to use approximation methods to help solve QM problems. You will learn the basic concepts and applications of time dependent Quantum mechanics to problems in molecular, chemical and spectroscopic problems.

The second part of the course aims to introduce the principles of statistical thermodynamics. You will understand how macroscopic thermodynamic properties of molecular systems can be derived from microscopic quantum mechanical properties by applying statistical thermodynamics.

Intended Learning Outcomes (ILO)

Upon successful completion of this course, you should be able to:

1. Recognize, interpret and apply the basic concepts of Quantum Mechanics (QM) including superposition, outcomes of measurements, & uncertainty principle and the noncommutability of operators.
2. Use basis sets, complex vector space, bra-ket notation and matrices to formulate and solve QM problems.
3. Explain, identify and apply the main concepts of approximation techniques in time independent QM, including Perturbation theory and the Variational method; Explain and identify basic molecular orbital theory by the application of the Rayleigh-Ritz method.
4. Explain, identify and apply the main concepts of time-dependent QM; apply perturbation theory to solve time-dependent QM problems; Explain and identify basic phenomena of light-matter interaction (spectroscopy) by time-dependent QM.
5. Explain the concept of statistical distribution functions and their occurrence in macroscopic systems with $10^{23}$ particles; compute the various parameters that characterize distribution functions.
6. Describe the Boltzmann distribution and use it to calculate the relative populations of different eigenstates of a molecule; describe the molecular partition function and extend it to the ensemble partition for both distinguishable and indistinguishable particles.
7. Formulate partition functions for the translational, rotational, vibrational, and electronic degrees of freedom of a molecule in the gas phase; derive the Maxwell-Boltzmann distribution; explain the role of nuclear spin statistics in the calculation of the rotational partition function.
8. Employ molecular partition functions to compute various thermodynamic quantities, including chemical equilibrium constants; apply the transition state theory to calculate reaction rate constants.
Course Content

The course can be divided into two parts:

Part 1: Quantum Mechanics in Chemistry

Brief review of basic concepts in Quantum Mechanics (QM). Use examples of simple systems to illustrate and reinforce the basic concepts.

Introduction to the use of basis sets, complex vector space and matrices to formulate questions in QM.

Introduction to main methods of approximation in time independent QM, including 1) Perturbation theory and 2) Variational theorem and Rayleigh-Ritz method: applications to explain molecular orbital theory.

Introduction to time dependent QM. Apply perturbation theory to solve time dependent QM problems.

Applications to Light-matter interaction (spectroscopy) in simple systems.

Part 2: Statistical Thermodynamics

Brief review of probability and statistics.

Microstates, configurations, Boltzmann distribution law, the molecular partition function, Ergodic hypothesis and the a priori postulate of statistical thermodynamics.

Ensemble partition function, derivation of thermodynamic parameters – internal energy, Gibbs free energy, Helmholtz free energy, enthalpy, entropy, pressure, chemical potential – from partition functions.

Translational partition function, Maxwell-Boltzmann Distribution Law.

Partition functions for the electronic degree of freedom, atomic and molecular term symbols.

Partition functions for vibrational and rotational degrees of freedom, nuclear spin statistics.

Application to the calculation of chemical equilibrium constant and chemical reaction rate constants, transition-state theory.

Assessment (includes both continuous and summative assessment)

Formative feedback

You will be given feedback in four ways:
1. By working through examples provided during lectures
2. By response to postings on the course discussion board
3. By attending consultation hours
4. By studying the comments provided by the instructors after the grading of homework and midterm tests

Learning and Teaching approach

Lectures
   Face-to-face lectures will be employed to enable you to interact directly with the instructor.

Reading and References

Course Policies and Student Responsibilities

(1) General
   You are expected to read the lecture materials prior to the lecture session in question. This will help you to learn much more efficiently as you will already have an impression on the topics to be covered. You should also read the textbook and to attempt the exercises provided in the problem sets.

(2) Absenteeism
   If you miss a lecture, you are expected to make up for the lost learning activities. If you miss the mid-term test with approval, you will either be offered a make-up test or grading based upon the final exam score.

Academic Integrity
Good academic work depends on honesty and ethical behaviour. The quality of your work as a student relies on adhering to the principles of academic integrity and to the NTU Honour Code, a set of values shared by the whole university community. Truth, Trust and Justice are at the core of NTU’s shared values.

As a student, it is important that you recognize your responsibilities in understanding and applying the principles of academic integrity in all the work you do at NTU. Not knowing what is involved in maintaining academic integrity does not excuse academic dishonesty. You need to actively equip yourself with strategies to avoid all forms of academic dishonesty, including plagiarism, academic fraud, collusion and cheating. If you are uncertain of the definitions of any of these terms, you should go to the academic integrity website for more information. Consult your instructor(s) if you need any clarification about the requirements of academic integrity in the course.

CBC Programme Learning Outcome

The Division of Chemistry and Biological Chemistry (CBC) offers an undergraduate degree major in Chemistry that satisfies the American Chemical Society (ACS) curricular guidelines and equips students with knowledge relevant to the industry. Graduates of the Division of Chemistry and Biological Chemistry should have the following key attributes:

1. **Competence**
   Graduates should be well-versed in the foundational and advanced concepts of chemical science, be able to evaluate chemistry-related information critically and independently, and be able to use complex reasoning to solve emergent chemical problems.

2. **Creativity**
   Graduates should be able to synthesize and integrate multiple ideas across the curriculum, and propose innovative solutions to emergent chemistry-related problems based on their training in chemistry.

3. **Communication**
   Graduates should be able to demonstrate clarity of thought, independent thinking, and sound scientific analysis and reasoning through written and oral reports to audiences with varying technical backgrounds. They should also be able to effectively engage other professional chemists in collaborative endeavours.

4. **Character**
   Graduates should be able to act in responsible ways and uphold the high ethical standards that the society expects of professional chemists.

5. **Civic-mindedness**
   Graduates should be aware of the impact of chemistry on society, and how chemistry can be applied to benefit mankind. They should also be aware of and uphold the best chemical safety practices.
