When twisted close to a magic relative orientation angle near 1 degree, bilayer graphene has flat moire superlattice minibands that have emerged as a rich and highly tunable source of strong correlation physics, notably the appearance of superconductivity close to interaction-induced insulating states. Here we report on the fabrication of bilayer graphene devices with exceptionally uniform twist angles. We show that the reduction in twist angle disorder reveals insulating states at all integer occupancies of the four-fold spin/valley degenerate flat conduction and valence bands, i.e. at moire band filling factors $\nu = 0, +(-) 1, +(-) 2, +(-) 3$, and reveals new superconductivity regions below critical temperatures as high as 3 K close to -2 filling. In addition we find novel orbital magnetic states with non-zero Chern numbers. Our study shows that symmetry-broken states, interaction driven insulators, and superconducting domes are common across the entire moire flat bands, including near charge neutrality. We further will discuss recent experiments including screened interactions, fragile topology and the first applications of this amazing new materials platform.

Etiquette for Remote Seminars:
(i) Please use a Headphone set or be in a quiet place whilst connecting to the seminar; Please mute your microphone and web camera in order to keep the Zoom room clear for everyone.
(ii) Please use a clearly identifiable name when using Zoom
(iii) If you have a question, click the “Raise Hand” icon and wait to be called by the moderator, you can then unmute your microphone.
(iv) For technical difficulties, or if you need to record your attendance of the seminar, please Zoom private chat Arpit Arora.

Host: Justin Song
